

# SFP-GSX-MM-1310-LC

SFP MODULE 1000FX MMF 1310NM

BUDGET 2KM

## Features

- Up to 1.25Gbps data rate
- 1310nm FP Laser and PIN photo detector
- Duplex LC receptable optical interface compliant
- Single +3.3V power supply
- Hot-pluggable
- Metal enclosure, for lower EMI
- International Class 1 laser safety certified
- Operating temperature range: Industrial: -40°C~+85°C
- RoHS Compliant
- DDMI function available with internally calibrated mode
- Up to 2km transmission distance over Multi Mode Fiber (MMF) OM2/OM3

## Ordering Information

Part Number	Designation
SFP-GSX-MM-1310-LC	SFP module 1000FX, multimode 1310nm, budget for 2km , connector LC, -40C to +85C

## Absolute Maximun Ratings

PARAMETER	SYMBOL	MIN	MAX	UNITS

Loss	Optical De-assert P <sub>D</sub>			-20	dBm	4
	Optical Assert P <sub>A</sub>	38				
Loss of Signal-Deasserted		0.5	2	6	dB	5

### Notes:

1. The supply current is SFP module's working current.
2. For the measurements, the device was driven with 1.25Gbps data pattern with 27-1 PRBS payload.
3. Optical transition time is the time interval required for the rising or falling edge of an optical pulse to transition between the 20% and 80% amplitudes relative to the logical 1 and 0 levels
4. Measured with a PRBS 27-1 test pattern, @1.25Gbps, ER=9dB, BER<10<sup>-12</sup>
5. The LOS Hysteresis minimizes 'chatter' on the output line. In principle, Hysteresis alone does not guarantee chatter-free operation.

**Notes:**

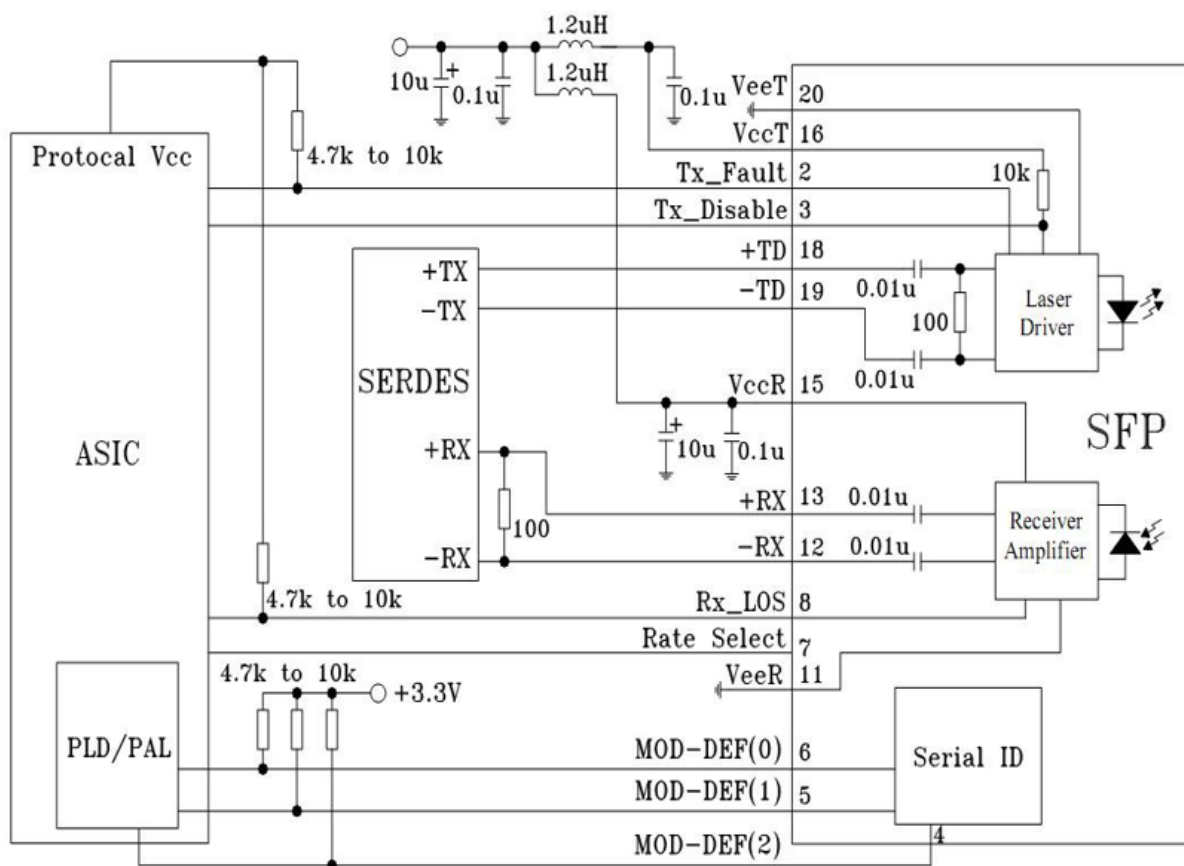

- TX Fault is open collector/drain output which should be pulled up externally with a 4.7K – 10KΩ resistor on the host board to supply <VccT+0.3V or VccR+0.3V. When high, this output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to <0.8V.
- TX Disable input is used to shut down the laser output per the state table below. It is pulled up within the module with a 4.7K – 10K Resistor.  
Low (0 – 0.8V): Transmitter on  
Between (0.8V and 2V): Undefined High  
(2.0 – VccT): Transmitter Disabled  
Open: Transmitter Disabled
- Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up with a 4.7 – 10K Resistor on the host board to supply less than VccT+0.3V or VccR+0.3V.  
Mod-Def 0 is grounded by the module to indicate that the module is present.  
Mod-Def 1 is clock line of two wire serial interface for optional serial ID.  
Mod-Def 2 is data line of two wire serial interface for optional serial ID.
- LOS (Loss of signal) is an open collector/drain output which should be pulled up externally with a 4.7 – 10K resistor on the host board to supply <VccT+0.3V or VccR+0.3V. When high, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to <0.8V.
- RD-/+ : These are the differential receiver outputs. They are AC coupled 100Ω differential lines which should be terminated with 100Ω differential at the user SERDES. The AC coupling is done inside the module and thus not required on the host board.
- VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V±5% at the SFP connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.
- TD-/+ : These are the differential transmitter inputs. They are AC coupled differential lines with 100Ω differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.
